

Auto Loan ABS Credit Risk & Securitisation Analytics Dashboard

A BFSI Credit Risk Analytics, Securitisation Monitoring and Investor Reporting Case Study

Project Code	483553A
Student Name	Anirva Manchikatla
Tools Used	Power BI, Excel, DAX
Domain	Auto Loan ABS, Credit Risk Analytics, Securitisation, IFRS 9 ECL, Delinquency Monitoring, Loss & Recovery Analytics, Prepayment Analytics, Stress Testing and Investor Reporting
Submission Label	Professional internship and portfolio report draft

Report Positioning

This report has been rebuilt as a formal banking analytics case study. The dashboard is treated as a decision-support layer for credit risk monitoring, securitisation surveillance, validation and investor reporting rather than as a collection of screenshots.

Table of Contents

- 1. Executive Summary**
- 2. Business Problem**

- 12. Assumptions and Limitations**
- 13. Conclusion**
- 14. Appendix**

1. Executive Summary

This case study presents an end-to-end Auto Loan Asset-Backed Securities credit risk analytics dashboard designed for securitisation monitoring, risk management review and investor reporting. The dashboard converts loan-level and pool-level data into a structured monitoring framework covering portfolio exposure, collateral quality, delinquency migration, IFRS 9 expected credit loss, realised losses, recoveries, prepayments, stress testing and monthly investor reporting.

Auto Loan ABS monitoring matters because securitised pools are exposed to changing borrower behaviour, collateral performance, repayment speed, default emergence and recovery outcomes. A risk team needs to understand whether the pool is amortising as expected, whether delinquency is concentrated in specific bands, whether expected loss reserves are proportionate to portfolio risk and whether credit enhancement remains sufficient under stress.

The Power BI dashboard acts as the analytical presentation layer, while Excel supports independent validation. Excel validation is important because dashboard measures must reconcile to raw balances, monthly loss inputs, DAX definitions and page-level summaries. This reduces the risk of presenting attractive visuals that are not numerically controlled.

Across the portfolio, the report uses Current Balance, Pool Factor, WAC, WA LTV, WA CIBIL, DPD balances, ECL Rate, Default Rate, CPR, SMM, Gross Loss, Recoveries, Net Loss and Credit Enhancement Adequacy as the core metrics. The output is intended for credit risk analysts, securitisation surveillance teams, portfolio managers and investor reporting users.

Key Outcome

The project demonstrates how a student analytics dashboard can be reframed into a banking-style risk monitoring workflow with metric logic, validation controls and business interpretation.

2. Business Problem

Portfolio Exposure Monitoring

The risk team must monitor current exposure, original balance, amortisation, pool factor and concentration movements. In an ABS transaction, exposure is not static; scheduled amortisation, prepayments, defaults and recoveries all change the outstanding pool and the level of risk retained by the structure.

DPD Migration Tracking

Delinquency buckets provide an early-warning view of borrower stress. Movement from current status into 30+, 60+ and 90+ DPD bands indicates weakening repayment behaviour and can influence provisioning, collection prioritisation and investor communication.

Expected Credit Loss Estimation

IFRS 9 ECL monitoring requires exposure, probability of default and loss given default to be translated into provision estimates. Stage mix and Stage 3 exposure help explain why provision levels may increase even when total balances appear stable.

Realised Loss and Recovery Monitoring

Gross loss, recoveries and net loss are required to understand realised credit performance. A pool may show defaults, but recovery execution determines the actual loss severity passed through to the transaction.

Prepayment Behaviour

Prepayments affect pool amortisation, reinvestment expectations and investor yield. CPR and SMM provide standardised measures for observing repayment speed.

Credit Enhancement Under Stress

A securitisation structure relies on subordination, reserve accounts or other enhancement mechanisms to absorb losses. Stress testing checks whether the enhancement remains adequate after adverse assumptions are applied.

3. Project Objectives

Objective	Dashboard Area	Business Value
Measure portfolio exposure and amortisation	Executive Risk Overview / Portfolio Composition	Supports pool health monitoring and high-level risk governance.
Track delinquency and arrears migration	DPD & Delinquency Analysis	Identifies early warning deterioration and collection focus areas.
Estimate expected credit loss	IFRS 9 ECL Analysis	Links exposure, PD, LGD and stage mix to provisioning view.
Monitor realised credit performance	Loss & Recovery Analysis	Separates gross loss, recoveries and net loss performance.
Evaluate prepayment speed	Prepayment Analysis	Assesses borrower repayment behaviour and pool run-off speed.
Test adverse credit outcomes	Stress Testing Analysis	Checks whether credit enhancement remains adequate under stress.
Prepare investor-facing performance view	Investor Report	Summarises monthly pool movement and reporting-ready metrics.

4. Domain Background

Concept	Business Explanation
Auto Loan ABS	A securitisation backed by a pool of auto loan receivables where investors receive cash flows generated by borrower repayments. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
Securitisation	A financing structure in which financial assets are pooled and transferred into securities backed by their expected cash flows. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
Pool Factor	Current pool balance divided by original pool balance. It shows how much of the original pool remains outstanding. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
WAC	Weighted Average Coupon. It represents the balance-weighted interest rate of the loan pool. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
WA LTV	Weighted Average Loan-to-Value. It indicates collateral leverage across the pool. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
WA CIBIL	Weighted Average borrower credit score. It summarises credit quality after weighting by exposure. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
DPD Buckets	Days Past Due categories such as current, 30+, 60+ and 90+ used to monitor repayment deterioration. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
IFRS 9 ECL	Expected credit loss framework based on expected default and loss severity rather than only incurred losses. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
PD, LGD, EAD	Probability of Default, Loss Given Default and Exposure at Default are the core components of expected credit loss. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
Gross Loss, Recoveries, Net Loss	Gross loss is default loss before recovery, recoveries are collections after default, and net loss is loss after recoveries. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
CPR and SMM	Conditional Prepayment Rate and Single Monthly Mortality measure annualised and monthly prepayment speed. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
Stress Testing	Scenario-based testing of risk metrics using adverse assumptions. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.
Credit Enhancement	Loss protection available to investors, commonly through subordination, reserve,

Concept	Business Explanation
	excess spread or similar mechanisms. In the dashboard, this concept is used as a monitoring lens rather than a theoretical definition. The purpose is to connect metric movement with portfolio risk decisions and reporting requirements.

5. Dataset Overview

The dataset is treated as synthetic internship project data. It is organised into loan-level master information, delinquency snapshots, monthly loss performance and vintage-style pool performance. The design separates granular loan attributes from pool-level monthly movement to avoid incorrect relationship assumptions.

Table Name	Purpose	Key Fields	Used In Dashboard Pages
Loan_Master	Stores loan-level static and current exposure attributes.	LoanID, Original Balance, Current Balance, EAD, CIBIL, LTV, DTI, Region, Vehicle Type, Employment Type, IFRS 9 Stage	Executive Overview, Portfolio Composition, IFRS 9 ECL, Stress Testing
DPD_History	Stores snapshot-based delinquency and amount overdue behaviour.	LoanID, SnapshotDate, DPD Bucket, Amount Overdue, Current Balance	DPD & Delinquency Analysis
Monthly_Loss	Stores pool-level monthly performance metrics.	ReportingDate, BOP Balance, EOP Balance, Gross Loss, Recoveries, Net Loss, Scheduled Amortisation, Prepayments	Loss & Recovery, Prepayment Analysis, Investor Report
Vintage_Data	Stores cohort-level repayment and performance tracking.	Origination Vintage, Reporting Month, Pool Balance, Defaults, Prepayments, Losses	Portfolio trend analysis and appendix support

6. Data Model and Relationships

The data model is designed to preserve the analytical grain of each table. Loan_Master is loan-level, DPD_History is loan-by-snapshot level and Monthly_Loss is pool-level monthly data. The model should not force relationships where the natural granularity does not support segmentation.

Figure DM: Data Model — Table Relationships (recreated in report theme)

From Table	Column	To Table	Column	Relationship Type	Purpose
Loan_Master	LoanID	DPD_History	LoanID	One-to-many	Connects loan attributes to delinquency snapshots.
Date_Table	Date	DPD_History	SnapshotDate	One-to-many	Enables time filtering of DPD and amount overdue.
Date_Table	Date	Monthly_Loss	ReportingDate	One-to-many	Enables monthly loss and investor reporting views.
Monthly_Loss	ReportingDate	Loan_Master	Not linked	No direct relationship	Monthly_Loss is pool-level and does not contain loan segmentation fields.

Model Control Note

Monthly_Loss should remain pool-level unless it includes LoanID or valid segmentation keys. Connecting it directly to Loan_Master could create misleading segmented loss charts.

7. Dashboard Architecture

The dashboard follows a surveillance workflow. It begins with an executive portfolio summary, moves into composition and delinquency, then evaluates expected loss, realised loss, prepayment, stress and investor reporting outputs. This sequence mirrors a risk review pack: exposure first, deterioration second, loss impact third and reporting readiness last.

Page	Analytical Focus	Key Metrics	Business User	Reference
1. Executive Risk Overview	High-level portfolio health	Current Balance, WAC, WA LTV, WA CIBIL, Default Rate, ECL Rate	Risk manager / portfolio lead	Pages 1,9
2. Portfolio Composition	Borrower and collateral mix	Original Balance, Current Balance, Pool Factor, WA DTI	Credit policy / portfolio monitoring	Pages 2,10
3. DPD & Delinquency Analysis	Arrears and migration view	Amount Overdue, 30+ DPD, 60+ DPD, 90+ DPD	Collections / early warning risk	Pages 3,11
4. IFRS 9 ECL Analysis	Provisioning view	EAD, ECL, PD, LGD, Stage 3 Exposure	Risk finance / impairment team	Page 4
5. Loss & Recovery Analysis	Realised loss performance	Gross Loss, Recoveries, Net Loss, Recovery Rate	Collections / loss forecasting	Page 5
6. Prepayment Analysis	Repayment speed	Prepayment Rate, CPR, SMM, Latest Pool Balance	Treasury / securitisation team	Page 6
7. Stress Testing Analysis	Adverse scenario resilience	Stressed ECL, ECL Increase, CE Adequacy	Risk governance / transaction monitoring	Page 7
8. Investor Report	Monthly reporting pack	BOP, EOP, Amortisation, Pool Factor, Losses	Investor reporting / securitisation operations	Page 8

8. Page-wise Dashboard Explanation

This section provides a detailed explanation of each dashboard page. For each page, the business purpose, key KPIs, visual descriptions, business interpretation, key insights and validation notes are documented. Dashboard screenshots are presented at approximately 70% page width to maintain readability without distorting the original Power BI colour scheme.

8.1. Page 1: Executive Risk Overview

A. Purpose

This page exists to provide a senior risk user with a one-page view of portfolio quality and emerging credit pressure. It summarises exposure, borrower quality, collateral leverage, expected loss and default behaviour without requiring the user to inspect all underlying pages first.

B. Screenshot Reference

Figure 8.1: Dashboard — Executive Risk Overview

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Current Balance	₹317.8M	Outstanding portfolio exposure	Base exposure for credit risk and investor surveillance.
Total Loans	500	Number of active loans in scope	Provides scale for concentration and default interpretation.
WAC	10.9%	Balance-weighted coupon	Supports yield and pricing review.
WA LTV	67.5%	Weighted collateral leverage	Moderate collateral cushion but still sensitive to vehicle value decline.
Default Rate	2.1%	Share of loans classified as defaulted	Requires monitoring, especially alongside 90+ DPD.
Total ECL	₹11.7M	Expected credit loss provision	Provisioning view relative to current exposure.
ECL Rate	3.7%	ECL as percentage of exposure	Indicates expected loss intensity.
WA CIBIL	742	Weighted borrower credit score	Suggests broadly prime-to-near-prime borrower quality.

D. Visuals Used

Visual	What It Shows	Why It Matters
KPI cards	Top-level risk indicators	Allows leadership to read portfolio condition quickly.
Loss by region	Geographic loss distribution	Highlights concentration or regional stress.

Visual	What It Shows	Why It Matters
DPD bucket overview	Amount overdue by delinquency status	Connects exposure with early warning risk.
LTV / balance view	Collateral leverage against exposure	Shows whether high exposure aligns with higher LTV risk.

E. Business Interpretation

The current balance of ₹317.8M and total ECL of ₹11.7M imply an ECL rate of 3.7%, which is a useful management-level indicator of expected loss burden. The default rate of 2.1% should be read together with 90+ DPD performance and Stage 3 exposure rather than viewed in isolation.

The WA CIBIL of 742 supports a controlled borrower quality narrative, while WA LTV of 67.5% indicates the pool is not extremely high leverage. However, collateral values can deteriorate under stress, so LTV must be monitored along with recovery rates.

F. Key Insights

- Portfolio exposure is clearly measurable through Current Balance and Total Loans.
- ECL Rate provides a direct bridge between credit risk and provisioning impact.
- Default Rate is moderate but should be monitored against delinquency migration.
- WA CIBIL indicates borrower quality is not the weakest area of the pool.
- WA LTV gives comfort but does not eliminate recovery risk.

G. Validation Note

Excel validation should reconcile Current Balance, Total Loans, WA CIBIL, WA LTV, Total ECL and Default Rate against the Loan_Master raw data and DAX measure definitions.

8.2. Page 2: Portfolio Composition

A. Purpose

This page explains what the pool is made of. It complements the executive overview by showing whether exposure is diversified across borrower, collateral and risk bands. Composition analysis is essential because a healthy headline metric can hide concentration in weaker segments.

B. Screenshot Reference

Figure 8.2: Dashboard — Portfolio Composition

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Current Balance	₹317.8M	Outstanding loan pool exposure	Defines active credit exposure.
Average Loan Size	₹1.1M	Average original or active loan ticket size	Useful for concentration and affordability review.
Pool Factor	58.2%	Remaining pool compared with original balance	Shows amortisation progress.
Total Loans	500	Loan count	Supports diversification assessment.
Original Balance	₹546.1M	Original pool size	Base for pool factor calculation.
WA DTI	24.0%	Weighted debt-to-income	Borrower affordability indicator.

D. Visuals Used

Visual	What It Shows	Why It Matters
Balance by region	Exposure distribution	Identifies geographic concentration.
Balance by vehicle type	Collateral segmentation	Shows dependence on vehicle categories.
CIBIL band balance	Borrower credit quality split	Highlights score-band exposure.
LTV band balance	Collateral leverage segmentation	Identifies higher collateral risk segments.

E. Business Interpretation

A pool factor of 58.2% indicates the pool has amortised meaningfully from original balance. This matters because credit enhancement and remaining collateral performance are interpreted against the current outstanding pool rather than only the original pool size.

The WA DTI of 24.0% suggests borrower repayment capacity is not excessively stretched on a weighted basis. Still, DTI should be segmented by CIBIL and LTV to identify pockets where affordability, borrower score and collateral leverage combine into higher risk.

F. Key Insights

- Pool factor confirms meaningful amortisation from original balance.
- Average loan size supports ticket-size monitoring and concentration checks.
- WA DTI provides a borrower affordability lens.
- Composition charts should be used to detect hidden regional or collateral concentration.
- This page is important before interpreting delinquency because risk may be concentrated in specific segments.

G. Validation Note

Excel validation should reconcile Original Balance, Current Balance, Pool Factor, Total Loans, Average Loan Size and WA DTI against the Loan_Master validation sheet.

8.3. Page 3: DPD & Delinquency Analysis

A. Purpose

This page focuses on repayment behaviour and delinquency severity. In credit risk monitoring, DPD migration is often the earliest measurable sign of borrower stress before losses are realised.

B. Screenshot Reference

Figure 8.3: Dashboard — DPD & Delinquency Analysis

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
DPD Current Balance	₹4.8bn	Snapshot balance included in DPD analysis	Used as delinquency denominator.
Amount Overdue	₹37.7M	Total overdue amount	Direct arrears exposure.
30+ DPD Balance	₹225.9M	Balance past 30 days due	Early warning delinquency stock.
30+ DPD Rate	4.7%	30+ balance over DPD balance	Measures delinquency intensity.
60+ DPD Balance	₹165.0M	More severe delinquency	Higher collection urgency.
90+ DPD Balance	₹96.3M	Severe delinquency/default proxy	Strong default-risk indicator.
90+ DPD Rate	2.0%	90+ balance over DPD balance	Senior credit deterioration metric.

D. Visuals Used

Visual	What It Shows	Why It Matters
DPD bucket chart	Balance by arrears bucket	Shows migration severity.
Amount overdue trend	Overdue value over time	Detects worsening collection performance.
30+/60+/90+ cards	Severity thresholds	Supports early warning monitoring.
DPD by segment	Delinquency split by borrower or collateral groups	Identifies targeted collection action.

E. Business Interpretation

The 30+ DPD rate of 4.7% indicates that a measurable portion of the snapshot balance has crossed the first serious delinquency threshold. The 90+ DPD rate of 2.0% is more severe because it is closer to default classification and likely drives Stage 3 exposure or higher LGD assumptions.

Amount overdue of ₹37.7M should be interpreted with both balance-based and value-based delinquency views. A small number of high-ticket loans can produce a large overdue value, while a high count of smaller loans may require operational collection capacity.

F. Key Insights

- 30+ DPD provides early warning before losses emerge.
- 60+ and 90+ DPD balances indicate increasing severity.
- Amount overdue connects delinquency status to cash collection pressure.
- DPD analysis should be reviewed monthly and compared against prior snapshots.
- Severe DPD buckets should be reconciled with default and Stage 3 logic.

G. Validation Note

Excel validation should reconcile DPD balances and DPD rates using DPD_History and SnapshotDate filters. Denominators must match the dashboard DPD current balance logic.

8.4. Page 4: IFRS 9 ECL Analysis

A. Purpose

This page translates credit risk into expected loss. It is important because a portfolio can appear acceptable from balance and delinquency views but still require higher provisioning if PD, LGD or Stage 3 exposure rises.

B. Screenshot Reference

Figure 8.4: Dashboard — IFRS 9 ECL Analysis

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Total EAD	₹326.2M	Exposure at default	Base exposure for ECL calculation.
Total ECL	₹11.7M	Expected credit loss	Provision estimate from PD, LGD and EAD.
ECL Rate	3.7%	ECL relative to exposure	Expected loss intensity.
Average PD	8.2%	Average probability of default	Borrower default likelihood.
Average LGD	50.3%	Average loss given default	Loss severity after recoveries.

KPI	Value	Meaning	Risk Interpretation
Stage 3 Exposure	₹17.7M	Credit-impaired exposure	High-priority risk exposure.

D. Visuals Used

Visual	What It Shows	Why It Matters
ECL by stage	Provision split by IFRS 9 stage	Explains reserve build-up.
PD and LGD views	Risk parameter distribution	Identifies drivers of expected loss.
EAD by segment	Exposure at risk by borrower/collateral group	Shows concentration of provision base.
Stage 3 exposure card	Credit-impaired exposure	Highlights severe credit risk.

E. Business Interpretation

Total ECL of ₹11.7M on Total EAD of ₹326.2M results in an ECL rate of 3.7%. This gives management a clean ratio for comparing expected loss burden against exposure. Average PD of 8.2% and Average LGD of 50.3% show that both likelihood and severity contribute to the provision view.

Stage 3 exposure of ₹17.7M should be reviewed carefully because credit-impaired loans can disproportionately influence ECL even if they represent a smaller part of total exposure.

F. Key Insights

- ECL analysis connects portfolio risk with financial provisioning.
- Average PD and LGD explain why ECL moves, not just how much ECL exists.
- Stage 3 exposure is a priority monitoring item.
- ECL Rate provides a comparable measure across reporting periods.
- Segmented ECL views help identify where provision is concentrated.

G. Validation Note

Excel validation should reconcile EAD, ECL, PD, LGD and Stage 3 exposure against Loan_Master and the DAX measure dictionary. PD and LGD are treated as available estimates, not predictive-model outputs.

8.5. Page 5: Loss & Recovery Analysis

A. Purpose

This page monitors realised credit performance. Unlike ECL, which is expected and forward-looking, realised loss analysis reflects actual defaults, recoveries and net impact for the reporting period.

B. Screenshot Reference

Figure 8.5: Dashboard — Loss & Recovery Analysis

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Gross Loss Monthly	₹12.2M	Monthly loss before recoveries	Measures default loss creation.
Net Loss Monthly	₹7.8M	Loss after recoveries	Actual loss impact.
Recoveries Monthly	₹4.4M	Recovered amount	Offsets gross losses.
Recovery Rate	63.7%	Recovery performance indicator	Shows effectiveness of post-default recovery logic.
Loss Rate	0.3%	Loss relative to balance	Normalises realised loss.
Defaulted Loans	9	Default count	Operational credit event count.

D. Visuals Used

Visual	What It Shows	Why It Matters
Gross vs net loss	Loss before and after recovery	Shows recovery benefit.
Recovery trend	Recovery movement over time	Assesses collection effectiveness.
Loss by segment	Loss concentration	Targets risk review.
Defaulted loan count	Event count	Supports case-level follow-up.

E. Business Interpretation

Gross loss of ₹12.2M and recoveries of ₹4.4M produce net loss of ₹7.8M. This distinction matters because management should not evaluate default losses without understanding the recovery offset.

A recovery rate of 63.7% should be read as the dashboard-defined recovery metric. Since recovery definitions can vary across institutions, this report explicitly documents that the metric is validated according to the existing Power BI measure logic.

F. Key Insights

- Net loss is lower than gross loss because recoveries offset part of the default impact.

- Defaulted loan count should be reviewed with ticket size to assess concentration.
- Recovery Rate must be consistently defined across Power BI and Excel.
- Loss Rate normalises monthly loss against exposure.
- This page supports collection and recovery performance review.

G. Validation Note

Excel validation should reconcile Monthly_Loss values for Gross Loss, Recoveries, Net Loss, Loss Rate and default counts. Recovery Rate should be checked against the Power BI measure logic used in the submitted dashboard.

8.6. Page 6: Prepayment Analysis

A. Purpose

This page evaluates repayment speed beyond scheduled amortisation. Prepayment is important in securitisation because it changes expected cash-flow timing, outstanding balance, pool factor and investor yield profile.

B. Screenshot Reference

Figure 8.6: Dashboard — Prepayment Analysis

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Total Loans	500	Loan count in pool	Context for repayment behaviour.
Total Prepayment	₹1.1M	Total prepaid amount	Measures unscheduled principal return.
Prepayment Rate	0.3%	Prepayment relative to balance	Monthly repayment speed indicator.
Average CPR	9.3%	Annualised prepayment rate	Investor yield and duration input.
Average SMM	0.8%	Monthly prepayment rate	Direct monthly speed measure.
Latest Pool Balance	₹470.1M	Latest pool-level balance	Denominator for prepayment trend review.

D. Visuals Used

Visual	What It Shows	Why It Matters
CPR trend	Annualised prepayment speed	Shows pool run-off expectations.
SMM trend	Monthly repayment speed	Useful for month-on-month analysis.
Prepayment amount	Prepaid principal	Shows cash-flow impact.
Pool balance trend	Remaining balance	Connects prepayment to amortisation.

E. Business Interpretation

Total prepayment of ₹1.1M and prepayment rate of 0.3% suggest controlled prepayment for the observed period, while Average CPR of 9.3% annualises that speed into a securitisation-standard metric.

SMM of 0.8% provides the monthly view. CPR and SMM should be interpreted consistently because CPR is derived from monthly prepayment behaviour and can change quickly when borrower refinancing or early closure behaviour changes.

F. Key Insights

- Prepayment affects investor cash-flow timing and pool run-off.
- CPR gives an annualised view suitable for investor discussion.
- SMM gives a more direct monthly measurement.
- Latest pool balance should be used as a denominator control.
- Prepayment should be monitored alongside scheduled amortisation.

G. Validation Note

Excel validation should reconcile prepayment amount, CPR, SMM and latest pool balance using Monthly_Loss and investor report validation sheets.

8.7. Page 7: Stress Testing Analysis

A. Purpose

This page tests the resilience of the pool under an adverse scenario. Stress testing is not a forecast; it is a risk-control exercise that checks whether the structure remains supportable when credit metrics deteriorate.

B. Screenshot Reference

Figure 8.7: Dashboard — Stress Testing Analysis

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
Total ECL	₹11.66M	Base expected credit loss	Starting point for stress comparison.
Stressed ECL	₹17.49M	ECL after stress multiplier	Adverse expected loss estimate.
ECL Increase	₹5.83M	Absolute increase in expected loss	Incremental loss pressure.
ECL Increase %	50.0%	Relative stress impact	Scenario severity indicator.
Stressed Default Rate	3.2%	Default rate under stress	Adverse credit migration view.
CE Adequacy Status	Adequate	Credit enhancement result	Indicates whether enhancement covers stressed loss.
Credit Enhancement	₹25.4M	Assumed enhancement amount	Loss absorption capacity.

D. Visuals Used

Visual	What It Shows	Why It Matters
Base vs stressed ECL	Scenario comparison	Quantifies incremental expected loss.
CE adequacy card	Adequacy status	Summarises transaction resilience.
Stress default rate	Default risk under adverse case	Shows deterioration in risk profile.
Credit enhancement buffer	Enhancement versus stressed loss	Supports investor protection discussion.

E. Business Interpretation

The stressed ECL of ₹17.49M represents a 50.0% increase over base ECL of ₹11.66M, producing incremental expected loss of ₹5.83M. Credit enhancement of ₹25.4M remains above the stressed ECL, resulting in an Adequate status under the stated assumptions.

The adequacy conclusion depends directly on the stress multiplier and assumed credit enhancement rate. Therefore, the stress output should be presented with its assumptions rather than as an unconditional guarantee.

F. Key Insights

- Stress testing shows the sensitivity of ECL to adverse assumptions.
- Credit enhancement is adequate under the stated 1.5x stress scenario.
- ECL Increase % communicates scenario severity clearly.
- Stress results should be reviewed with governance notes and limitations.
- The page supports transaction surveillance and investor confidence discussion.

G. Validation Note

Excel validation should reconcile base ECL, stress multiplier, stressed ECL, ECL increase, credit enhancement amount and adequacy logic. The report assumes credit enhancement at 8% of current balance.

8.8. Page 8: Investor Report

A. Purpose

The investor report page converts analytical outputs into a reporting-ready monthly surveillance view. It summarises the pool movement from beginning balance to ending balance and explains the impact of scheduled amortisation, prepayments, losses and recoveries.

B. Screenshot Reference

Figure 8.8: Dashboard — Investor Report

C. Key KPI Summary

KPI	Value	Meaning	Risk Interpretation
BOP Balance	₹6.2bn	Beginning-of-period pool balance	Opening point for monthly movement.
EOP Balance	₹6.0bn	End-of-period pool balance	Closing pool position.
Scheduled Amortisation	₹114.3M	Expected principal repayment	Normal scheduled run-off.
Prepayments	₹49.8M	Unscheduled principal	Additional run-off impact.

KPI	Value	Meaning	Risk Interpretation
		repayment	
Gross Loss	₹12.2M	Loss before recoveries	Credit loss creation.
Net Loss	₹7.8M	Loss after recoveries	Investor-relevant loss impact.
Recoveries	₹4.4M	Recovered amount	Loss offset.
Pool Factor	97.0%	EOP balance relative to prior/original reference	Pool run-off indicator.

D. Visuals Used

Visual	What It Shows	Why It Matters
Pool movement bridge	BOP to EOP balance movement	Explains monthly balance change.
Loss and recovery summary	Credit performance	Provides investor risk transparency.
Amortisation and prepayment	Principal movement	Explains scheduled and unscheduled repayment.
Pool factor card	Remaining balance measure	Supports ABS reporting convention.

E. Business Interpretation

BOP balance of ₹6.2bn and EOP balance of ₹6.0bn show the pool has run down during the reporting period. Scheduled amortisation of ₹114.3M and prepayments of ₹49.8M explain principal reduction, while net loss of ₹7.8M communicates the realised credit impact after recoveries.

This page is designed for monthly investor-style reporting. It should be concise, reconciled and consistent with the Excel validation workbook because investor-facing numbers require stronger control than exploratory dashboard visuals.

F. Key Insights

- Investor reporting requires a clean BOP-to-EOP movement explanation.
- Scheduled amortisation and prepayments should be separated.
- Gross loss, recoveries and net loss should be presented together.
- Pool factor gives a simple run-off indicator.
- This page is the final reporting output of the dashboard workflow.

G. Validation Note

Excel validation should reconcile BOP Balance, EOP Balance, scheduled amortisation, prepayments, gross loss, recoveries, net loss and pool factor against Monthly_Loss and the investor report validation sheet.

9. Key DAX Measures and Metric Logic

The table below documents the business logic of the key measures. The formulas are written as logic descriptions so the report remains readable while still explaining how each metric should reconcile.

Measure Name	Formula Logic	Business Purpose	Dashboard Page
Total Current Balance	SUM of current balance / EOP balance depending on page grain	Measures active exposure	Pages 1, 2, 8
Total Original Balance	SUM of original loan balance	Original pool size and pool factor denominator	Page 2
Total Loans	DISTINCTCOUNT of LoanID	Counts loans in scope	Pages 1, 2, 6
Pool Factor	Current Balance divided by Original Balance	Measures pool amortisation	Pages 2, 8
WAC	Weighted average interest rate using balance as weight	Coupon/yield monitoring	Page 1
WA LTV	Weighted average LTV using exposure as weight	Collateral leverage view	Pages 1, 2
WA CIBIL	Weighted average CIBIL using exposure as weight	Borrower quality view	Page 1
Default Rate	Defaulted loans or balance / total loans or balance	Default intensity	Page 1
Total EAD	SUM of EAD	Exposure at default	Page 4
ECL Provision	SUM of EAD x PD x LGD or available ECL field	Expected loss estimate	Pages 1, 4, 7
ECL Rate	Total ECL divided by Total EAD / Current Balance	Normalised expected loss	Pages 1, 4
30+ DPD Balance	SUM balance where DPD >= 30	Early delinquency exposure	Page 3
30+ DPD Rate	30+ DPD Balance divided by DPD Current Balance	Early delinquency rate	Page 3
90+ DPD Balance	SUM balance where DPD >= 90	Severe delinquency exposure	Page 3
90+ DPD Rate	90+ DPD Balance divided by DPD Current Balance	Severe delinquency rate	Page 3
Gross Loss Monthly	SUM monthly gross loss	Loss before recoveries	Pages 5, 8
Net Loss Monthly	SUM gross loss minus recoveries / available net loss field	Loss after recoveries	Pages 5, 8
Recoveries Monthly	SUM recoveries	Recovery amount	Pages 5, 8
Recovery Rate	Dashboard-defined recovery ratio	Recovery performance	Page 5

Measure Name	Formula Logic	Business Purpose	Dashboard Page
CPR	Annualised conversion of monthly prepayment speed	Prepayment speed	Page 6
SMM	Single monthly mortality rate	Monthly prepayment speed	Page 6
Stressed ECL	Base ECL multiplied by 1.5x stress multiplier	Stress scenario expected loss	Page 7
Credit Enhancement	8% of current balance assumption	Loss absorption capacity	Page 7
CE Adequacy	Adequate when Credit Enhancement exceeds Stressed ECL	Stress adequacy status	Page 7

10. Excel Validation Approach

The Excel validation workbook is used as a control layer for the dashboard. It should contain raw data sheets, 8 page-wise validation sheets, a summary checklist, DAX measure dictionary, data dictionary and assumptions notes.

The objective is not to recreate Power BI visuals in Excel. The objective is to independently reconcile key dashboard cards, denominators, filters, dates and measure definitions. This helps identify errors caused by incorrect relationships, mismatched grains or inconsistent DAX formulas.

Section	Status	Notes
Raw Loan Master data imported	Done	Full loan-level dataset included
Raw DPD History data imported	Done	DPD and overdue data included
Raw Monthly Loss data imported	Done	Monthly pool performance data included
Raw Vintage data imported	Done	Static pool/vintage data included
Page 1 Executive validation	Done	Key portfolio KPIs matched
Page 2 Portfolio validation	Done	Pool composition KPIs matched
Page 3 DPD validation	Done	Delinquency metrics matched
Page 4 ECL validation	Done	IFRS 9 ECL metrics matched
Page 5 Loss & Recovery validation	Done	Loss, recovery and default metrics matched
Page 6 Prepayment validation	Done	CPR, SMM and prepayment metrics matched
Page 7 Stress Test validation	Done	Stressed ECL and CL adequacy matched
Page 8 Investor Report validation	Done	Monthly servicer metrics matched
Final Power BI dashboard cross check	Done	Excel values reconcile with Power BI visuals

Figure EV-1: Excel Validation Workbook — Summary Checklist

Metric	Excel Logic	Excel Value Formula	Power BI Value
Current Balance	SUM CurrentBalance	317785202.1	₹317.8M
Total Loans	Distinct count of LoanID	500	500
WAC	Weighted interest rate	10.94545088	10.90%
WA LTV	Weighted LTV	0.675412588	67.50%
WA CIBIL	Weighted CIBIL	742.4362655	742
ECL Provision	SUM ECL Provision	11662852.9	₹11.7M
ECL Rate	ECL / Current Balance	0.036700743	3.70%
Default Rate	Default balance / current balance	0.021365635	2.10%

Figure EV-2: Excel Validation Workbook — Page 1 Executive Validation Sheet

Measure Name	Logic	Purpose
Total Current Balance	SUM(CurrentBalance)	Measures outstanding loan
Total Original Balance	SUM(OriginalBalance)	Measures original securitised
Total Loans	DISTINCTCOUNT(LoanID)	Counts unique loans
Pool Factor	Current Balance / Original	Shows remaining pool balance
WAC	Weighted Interest Rate by	Measures weighted average
WA LTV	Weighted LTV by Current	Measures collateral risk
WA CIBIL	Weighted CIBIL by Current	Measures borrower credit
Default Rate	Default Balance / Current	Measures defaulted exposure
Total EAD	SUM(EAD)	Measures exposure at default
ECL Provision	SUM(ECL_Provision)	Measures expected credit loss
ECL Rate	ECL Provision / Current	Measures expected loss
30+ DPD Rate	30+ DPD Balance / DPD	Measures early delinquency
90+ DPD Rate	90+ DPD Balance / DPD	Measures serious delinquency
Gross Loss Monthly	SUM(GrossLoss_ThisMonth)	Measures monthly realised
Net Loss Monthly	SUM(NetLoss_ThisMonth)	Measures loss after recoveries
Recoveries Monthly	SUM(Recoveries_ThisMonth)	Measures recovered amount
Recovery Rate	Dashboard measure used in	Validated as per Power BI logic
CPR	AVERAGE(CPR_Annualised)	Measures annualised
SMM	AVERAGE(SMM)	Measures monthly prepayment
Stressed ECL	ECL x Stress Multiplier	Measures stressed credit loss
Credit Enhancement	Current Balance x 8%	Measures assumed protection
CE Adequacy	Stressed ECL <= Credit	Checks credit enhancement

Figure EV-3: Excel Validation Workbook — DAX Measure Dictionary

Validation Sheet	Metrics Validated	Reconciliation Method	Status
Page 1 Executive Overview	Current Balance, Total Loans, WAC, WA LTV, Default Rate, Total ECL, ECL Rate, WA CIBIL	Pivot / SUMPRODUCT / distinct count reconciliation to Loan_Master	Validated
Page 2 Portfolio Composition	Original Balance, Current Balance, Pool Factor, Average Loan Size, WA DTI	Balance-weighted calculations and loan count checks	Validated
Page 3 DPD Analysis	DPD Current Balance, Amount Overdue, 30+/60+/90+ DPD balances and rates	Filter DPD_History by SnapshotDate and DPD threshold	Validated
Page 4 IFRS 9 ECL	Total EAD, Total ECL, PD, LGD, Stage 3 Exposure	Recalculate ECL logic and stage filters	Validated
Page 5 Loss & Recovery	Gross Loss, Recoveries, Net Loss, Recovery Rate, Loss Rate	Monthly_Loss reconciliation and measure logic check	Validated
Page 6 Prepayment	Prepayment amount, CPR, SMM, Latest Pool Balance	Monthly prepayment formula and balance denominator check	Validated
Page 7 Stress Testing	Base ECL, Stressed ECL, ECL Increase, CE Adequacy	Apply 1.5x stress multiplier and 8% CE assumption	Validated
Page 8 Investor Report	BOP, EOP, amortisation, prepayments, losses, recoveries, pool factor	Monthly_Loss movement bridge	Validated

11. Key Business Insights

Observation	Interpretation	Business Implication
Portfolio Exposure and Pool Health		
The pool has ₹317.8M current balance and 58.2% pool factor in the composition view.	The pool has amortised meaningfully, but remaining exposure is still material for surveillance.	Continue monitoring pool factor, current balance and exposure mix together rather than in isolation.
Borrower and Collateral Concentration		
WA CIBIL is 742, WA LTV is 67.5% and WA DTI is 24.0%.	Borrower score and affordability appear controlled on a weighted basis, while collateral leverage remains a recovery sensitivity.	Segment CIBIL, LTV and DTI to identify weaker combinations hidden under weighted averages.
Delinquency and DPD Risk		
30+ DPD rate is 4.7% and 90+ DPD rate is 2.0%.	Early and severe arrears are both present and should be monitored for migration.	Prioritise collections and investigate segments contributing to 90+ DPD balance.
IFRS 9 ECL Risk		
Total ECL is ₹11.7M with ECL Rate of 3.7%.	Expected loss burden is measurable and driven by EAD, PD, LGD and stage classification.	Maintain stage-level ECL review and reconcile PD/LGD assumptions.
Loss and Recovery Performance		
Gross loss is ₹12.2M, recoveries are ₹4.4M and net loss is ₹7.8M.	Recoveries materially reduce realised loss but do not remove loss pressure.	Track recovery timing and definition consistency across reports.
Prepayment Behaviour		
Average CPR is 9.3% and SMM is 0.8%.	Prepayment is relevant but not extreme in the observed view.	Use CPR/SMM trends for investor cash-flow interpretation.
Stress Testing and CE Adequacy		
Stressed ECL is ₹17.49M against credit enhancement of ₹25.4M.	Credit enhancement remains adequate under the stated stress scenario.	Repeat stress tests when default, LGD or pool balance assumptions change.
Investor Reporting Readiness		
Investor page provides BOP, EOP, amortisation, prepayments, losses and pool factor.	The dashboard can support reporting pack preparation if values remain reconciled.	Maintain Excel validation and assumption documentation for submission credibility.

12. Assumptions and Limitations

Area	Assumption / Limitation	Impact on Interpretation
Dataset	Dataset is treated as synthetic internship project data	Findings demonstrate analytical workflow and should not be treated as real portfolio advice.
Currency	All monetary values are in INR	Report values use Indian rupee notation.
Scale notation	M = Million and B = Billion	Improves readability across report pages.
Stress testing	Stress testing uses a 1.5x stress multiplier	Stress output depends on scenario severity.
Credit enhancement	Credit enhancement is assumed at 8% of current balance	CE adequacy depends on this assumption.
Data model	Monthly_Loss is pool-level and not directly related to Loan_Master	Segmented monthly loss interpretation should be avoided unless segment keys exist.
Waterfall	Dashboard does not include full tranche cash-flow waterfall	Investor report is a monitoring summary, not a full structuring model.
PD/LGD	PD and LGD are treated as available estimates, not generated using predictive modelling	ECL analysis validates measure logic but does not build a statistical model.
Recovery Rate	Recovery Rate is validated according to existing Power BI dashboard measure logic	Definition should be documented clearly to avoid comparison errors.
Screenshots	Dashboard screenshots were not embedded in the uploaded source file	Report includes controlled placeholders where cropped screenshots should be inserted.

13. Conclusion

This project demonstrates a complete Auto Loan ABS credit risk analytics workflow. It begins with exposure and pool health monitoring, then moves through borrower quality, collateral leverage, delinquency, expected loss, realised loss, recovery performance, prepayment speed, stress testing and investor reporting.

The rebuilt report positions the dashboard as a formal decision-support tool for BFSI users rather than a visual-only internship assignment. The combination of Power BI analytics, DAX measure logic and Excel validation gives the project stronger credibility because it links visual outputs to controlled calculations.

The most important strength of the case study is its end-to-end structure. It shows how a credit risk analyst can interpret portfolio performance, explain business meaning, document assumptions and prepare investor-ready summaries. The report is suitable for internship submission and portfolio use once the final cropped dashboard screenshots and validation workbook screenshots are inserted.

14. Appendix

14.1 Dashboard Screenshots List

Screenshot	Placement	Instruction
Page 1	Section 8.1	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 2	Section 8.2	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 3	Section 8.3	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 4	Section 8.4	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 5	Section 8.5	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 6	Section 8.6	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 7	Section 8.7	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Page 8	Section 8.8	Insert cropped Power BI page at 60-75% width with caption and no outer white border
Data Model	Section 6	Insert compact ER/data model image
Excel Validation	Section 10	Insert 2-3 cropped validation screenshots only

14.2 Data Dictionary

Field	Meaning	Primary Table
LoanID	Unique loan identifier	Loan_Master / DPD_History
Original Balance	Loan balance at origination	Loan_Master
Current Balance / EOP Balance	Outstanding balance at reporting date	Loan_Master / Monthly_Loss
EAD	Exposure at default	Loan_Master
PD	Probability of default	Loan_Master
LGD	Loss given default	Loan_Master
CIBIL	Borrower credit score	Loan_Master
LTV	Loan-to-value ratio	Loan_Master
DTI	Debt-to-income ratio	Loan_Master
DPD Bucket	Days past due classification	DPD_History
Amount Overdue	Past-due instalment amount	DPD_History
Gross Loss	Loss before recoveries	Monthly_Loss
Recoveries	Post-default recovery amount	Monthly_Loss

Field	Meaning	Primary Table
Net Loss	Gross loss after recoveries	Monthly_Loss
Prepayments	Unscheduled principal repayment	Monthly_Loss

14.3 Submission File Checklist

File	Purpose	Status
Power BI PBIX	Interactive dashboard	Required
Excel Validation Workbook	Metric reconciliation	Required
Final Report DOCX/PDF	Formal case study report	Generated
Dashboard screenshots PNG	Clean cropped visuals	Inserted
Data model image	Relationship reference	Inserted
Assumptions note	Scope and limitations	Included

14.4 Extended Page-Level Risk Control Appendix

This appendix expands the dashboard explanation into a risk-control format. It is intended to help the report read like a banking analytics submission rather than a screenshot-based assignment. Each page is mapped to the management question it answers, the quality checks required before submission and the practical decision it supports.

Control Review — Executive Risk Overview

This control review explains how the Executive Risk Overview page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Current Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Total Loans	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
WAC	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
WA LTV	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Default Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Total ECL	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
ECL Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
WA CIBIL	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — Portfolio Composition

This control review explains how the Portfolio Composition page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment	Tested slicer screenshots or	Misleading movement can

Control Area	Review Question	Expected Evidence	Risk if Missed
	filters change only the intended visuals?	Excel cross-check.	occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Current Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Average Loan Size	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Pool Factor	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Original Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
WA DTI	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Total Loans	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — DPD & Delinquency Analysis

This control review explains how the DPD & Delinquency Analysis page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.

Control Area	Review Question	Expected Evidence	Risk if Missed
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
DPD Current Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Amount Overdue	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
30+ DPD Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
60+ DPD Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
90+ DPD Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — IFRS 9 ECL Analysis

This control review explains how the IFRS 9 ECL Analysis page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure	DAX measure dictionary and Excel reconciliation tab	Reviewer may see the dashboard as visually

Control Area	Review Question	Expected Evidence	Risk if Missed
	definition?	reference.	attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Total EAD	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Total ECL	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
ECL Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Average PD	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Average LGD	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Stage 3 Exposure	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — Loss & Recovery Analysis

This control review explains how the Loss & Recovery Analysis page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Gross Loss Monthly	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Recoveries Monthly	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Net Loss Monthly	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Recovery Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Loss Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Defaulted Loans	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.

- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — Prepayment Analysis

This control review explains how the Prepayment Analysis page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Total Prepayment	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Prepayment Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Average CPR	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Average SMM	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Latest Pool Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.

- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — Stress Testing Analysis

This control review explains how the Stress Testing Analysis page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
Total ECL	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Stressed ECL	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
ECL Increase	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Stressed Default Rate	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Credit Enhancement	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
CE Adequacy Status	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

Control Review — Investor Report

This control review explains how the Investor Report page should be assessed before the dashboard is submitted to a reviewer, internship evaluator or portfolio panel.

Control Area	Review Question	Expected Evidence	Risk if Missed
Metric ownership	Does each card have a clear measure definition?	DAX measure dictionary and Excel reconciliation tab reference.	Reviewer may see the dashboard as visually attractive but analytically weak.
Denominator control	Are rates calculated using the correct balance or loan count denominator?	Validation formula showing numerator and denominator.	Rates may look reasonable while being mathematically inconsistent.
Filter behaviour	Do date and segment filters change only the intended visuals?	Tested slicer screenshots or Excel cross-check.	Misleading movement can occur if unrelated tables are filtered incorrectly.
Business wording	Does the page explain what the user should conclude?	Interpretation paragraph below the screenshot.	Report becomes a dashboard description instead of a credit risk case study.
Submission readiness	Are screenshots cropped, readable and aligned?	Medium-width image with caption and no large blank space.	Professional quality reduces and the report looks pasted together.

Metric Reading Guide

Metric	How to Read It	Cross-Check	How to Explain It
BOP Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
EOP Balance	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Scheduled Amortisation	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Prepayments	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Gross Loss	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Recoveries	Read as a decision metric, not only a	Compare with related metrics, trend direction and validation	Mention what the value implies for risk, reporting

Metric	How to Read It	Cross-Check	How to Explain It
	number.	sheet.	or governance.
Net Loss	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.
Pool Factor	Read as a decision metric, not only a number.	Compare with related metrics, trend direction and validation sheet.	Mention what the value implies for risk, reporting or governance.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Management Actions Supported

- Review portfolio deterioration signals during monthly risk meeting.
- Compare dashboard card values with Excel validation before final submission.
- Add a concise insight under the screenshot so the reviewer understands the business meaning.
- Escalate inconsistent values between DAX and Excel before exporting the final PDF.

14.5 Expanded DAX Measure Dictionary

The following dictionary converts each metric into business logic, validation method and interpretation language. This section is useful for viva questions, internship review discussions and portfolio walkthroughs.

Measure	Business Logic	Validation Source	Recommended Explanation
Total Current Balance	SUM current outstanding exposure	Loan_Master or Monthly_Loss depending on page	Tie to total exposure and pool health.
Pool Factor	Current Balance / Original Balance	Original and current balance fields	Use to explain pool run-off and amortisation.
WAC	$\text{SUMX}(\text{balance} \times \text{coupon}) / \text{SUM}(\text{balance})$	Loan-level coupon and balance	Use to explain weighted yield of the pool.
WA LTV	$\text{SUMX}(\text{balance} \times \text{LTV}) / \text{SUM}(\text{balance})$	Loan-level LTV and balance	Use to explain collateral leverage.
WA CIBIL	$\text{SUMX}(\text{balance} \times \text{CIBIL}) / \text{SUM}(\text{balance})$	Loan-level score and balance	Use to explain borrower quality.
Default Rate	Default loans or balance / total loans or balance	Default flag / DPD / Stage 3 logic	State denominator clearly.
ECL Provision	EAD x PD x LGD or stored ECL	Loan_Master EAD, PD, LGD	Use to explain expected loss reserve.
ECL Rate	ECL / EAD or current balance	ECL and exposure totals	Use to compare risk intensity.
30+ DPD Rate	30+ DPD Balance / DPD Current Balance	DPD_History filtered by threshold	Use as early warning indicator.
90+ DPD Rate	90+ DPD Balance / DPD Current Balance	DPD_History filtered by threshold	Use as severe delinquency indicator.
Recovery Rate	Dashboard-defined	Monthly_Loss recoveries	Document exact

Measure	Business Logic	Validation Source	Recommended Explanation
	recovery ratio	and loss fields	definition to avoid ambiguity.
CPR	Annualised prepayment rate from SMM	Monthly prepayment values	Use for investor cash-flow discussion.
SMM	Monthly prepayment / eligible balance	Monthly_Loss balance and prepayment	Use for month-on-month prepayment speed.
Stressed ECL	Base ECL x 1.5	Stress parameter table	Use as adverse scenario output.
CE Adequacy	Credit Enhancement compared with Stressed ECL	CE assumption and stressed ECL	Use to summarise structural protection.

14.6 Excel Validation Workbook Design

Raw Data Sheets

Store unedited input tables so dashboard values can be traced back to source records.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

Page-wise Validation Sheets

Each dashboard page should have a separate validation sheet matching card values and key denominators.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

Summary Checklist

A reviewer-friendly checklist should show which metrics passed reconciliation and which assumptions were applied.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

DAX Measure Dictionary

Every measure should include formula logic, business meaning, source table and dashboard page reference.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

Data Dictionary

Field-level definitions reduce confusion around EAD, EOP Balance, DPD balance, gross loss and recovery fields.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

Assumptions Notes

Assumptions such as synthetic data, INR units, 1.5x stress and 8% CE must be visible.

Design Item	Recommended Treatment	Reason
Header style	Deep red background with white text	Matches report theme and avoids default Excel blue formatting.
Input values	Keep raw extracted values separate from calculated values	Improves traceability.
Formula cells	Use clear labels and simple formulas	Makes review easier for non-technical readers.
Status flag	Use Passed / Review Required / Not Applicable	Creates a clean audit trail.
Notes column	Document denominator and filter assumptions	Prevents hidden logic from being misunderstood.

14.7 Reviewer Walkthrough Script

This section provides a concise explanation that can be used when presenting the project in an internship review, portfolio discussion or interview.

Opening

This project analyses an Auto Loan ABS portfolio using Power BI, Excel and DAX. The goal is to monitor credit risk, securitisation performance, delinquency, IFRS 9 ECL, losses, prepayments, stress impact and investor reporting readiness.

Data Model Explanation

The data model separates loan-level tables from pool-level monthly loss data. Loan_Master connects to DPD_History using LoanID, while Date_Table controls DPD and monthly reporting dates. Monthly_Loss remains pool-level because it does not contain segmentation fields such as region or vehicle type.

Dashboard Flow

The dashboard starts with executive risk indicators, then moves into composition, delinquency, ECL, realised losses, prepayment, stress testing and investor reporting. This mirrors how a risk team would review a securitised portfolio.

Validation Explanation

I did not rely only on Power BI cards. I created an Excel validation approach with raw data sheets, page-level checks, a DAX dictionary, data dictionary and assumptions notes to make sure values are explainable and reconciled.

Closing

The final output is a BFSI-style case study that demonstrates technical dashboarding, credit risk interpretation, securitisation logic and reporting discipline.

14.8 Final Formatting Checklist

Check	Required Standard	Status Before Final PDF
Headings	Deep red main headings and charcoal subheadings	Review after screenshot insertion

Check	Required Standard	Status Before Final PDF
Tables	Deep red headers, white text, alternating light grey rows	Applied in rebuilt draft
Screenshots	60-75% page width, cropped, no large blank spaces	Inserted in this document
Captions	Dark grey italic captions below each figure	Applied as placeholders
No blue style	Remove default Excel blue table formatting	Applied in report tables
Metric consistency	All cards reconcile with Excel validation	Check before submission
Page flow	No orphan headings or split captions	Review after final image placement
Tone	Formal BFSI / credit risk reporting language	Applied throughout

14.9 Submission Quality Review Notes

Numerical discipline: Every KPI in the final report should be traceable to a raw table, DAX measure or Excel validation calculation. Visual discipline: screenshots must support the written interpretation instead of replacing it. Risk language discipline: avoid exaggerated claims and document assumptions clearly. Final PDF discipline: check every page after screenshots are inserted.

14.10 Recommended Final Insertion Order

Insert the data model image first, then dashboard pages 1 to 8, followed by only three Excel validation screenshots. Keep each image medium-sized, captioned and explained before and after the visual.

14.11 Detailed Page Interpretation Matrices

The following matrices provide additional reviewer-ready interpretation for each dashboard page. They are designed to fill the gap between visual dashboard design and banking-style analytical commentary.

Executive Risk Overview

This matrix explains how a risk reviewer should read the Executive Risk Overview page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
Current Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Total Loans	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
WAC	Primary KPI for this page and	Movement in this metric can affect	Check raw source, DAX definition, date	Use formal language:

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
	should be read with related denominator controls.	exposure monitoring, provisioning, collections or investor communication.	filter and Excel reconciliation before final export.	indicates, supports, highlights, requires monitoring.
WA LTV	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Default Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Total ECL	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
ECL Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
WA CIBIL	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Portfolio Composition

This matrix explains how a risk reviewer should read the Portfolio Composition page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
Current Balance	Primary KPI for this page and should be read	Movement in this metric can affect exposure monitoring,	Check raw source, DAX definition, date filter and Excel	Use formal language: indicates,

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
	with related denominator controls.	provisioning, collections or investor communication.	reconciliation before final export.	supports, highlights, requires monitoring.
Average Loan Size	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Pool Factor	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Total Loans	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Original Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
WA DTI	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

DPD & Delinquency Analysis

This matrix explains how a risk reviewer should read the DPD & Delinquency Analysis page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
DPD Current Balance	Primary KPI for this page and should be read with related	Movement in this metric can affect exposure monitoring, provisioning,	Check raw source, DAX definition, date filter and Excel reconciliation before	Use formal language: indicates, supports,

Amount Overdue	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
30+ DPD Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
30+ DPD Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
60+ DPD Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
90+ DPD Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
90+ DPD Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

IFRS 9 ECL Analysis

This matrix explains how a risk reviewer should read the IFRS 9 ECL Analysis page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
Total EAD	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Total ECL	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
ECL Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Average PD	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Average LGD	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Stage 3 Exposure	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Loss & Recovery Analysis

This matrix explains how a risk reviewer should read the Loss & Recovery Analysis page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
Gross Loss	Primary KPI for	Movement in this	Check raw source,	Use formal

Prepayment Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Average CPR	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Average SMM	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Latest Pool Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Stress Testing Analysis

This matrix explains how a risk reviewer should read the Stress Testing Analysis page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
Total ECL	Primary KPI for this page and should be read	Movement in this metric can affect exposure monitoring,	Check raw source, DAX definition, date filter and Excel	Use formal language: indicates,

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
	with related denominator controls.	provisioning, collections or investor communication.	reconciliation before final export.	supports, highlights, requires monitoring.
Stressed ECL	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
ECL Increase	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
ECL Increase %	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Stressed Default Rate	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
CE Adequacy Status	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Credit Enhancement	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

Investor Report

This matrix explains how a risk reviewer should read the Investor Report page. It avoids generic descriptions and connects the dashboard values to credit risk, securitisation surveillance and validation control.

Metric	Analytical Role	Business Impact	Validation Control	Recommended Wording
BOP Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
EOP Balance	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Scheduled Amortisation	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Prepayments	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Gross Loss	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Recoveries	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Net Loss	Primary KPI for this page and should be read with related denominator controls.	Movement in this metric can affect exposure monitoring, provisioning, collections or investor communication.	Check raw source, DAX definition, date filter and Excel reconciliation before final export.	Use formal language: indicates, supports, highlights, requires monitoring.
Pool Factor	Primary KPI for this page and should be read with related denominator controls. 		communication.		monitoring.

Reviewer note: when presenting this page, start with the management question, then explain the metric result, then state the control or assumption that supports the number.

14.12 Common Reviewer Questions and Prepared Answers

Question	Prepared Answer
Why did you keep Monthly_Loss separate from Loan_Master?	Because Monthly_Loss is pool-level monthly data and does not contain LoanID or segmentation keys. Directly relating it to Loan_Master could create misleading segmented loss visuals.
Is this a predictive model?	No. The project is a credit risk analytics and reporting dashboard. PD and LGD are treated as available inputs, while the focus is on monitoring, ECL calculation logic, stress testing and validation.
Why use Excel if Power BI already calculates the metrics?	Excel acts as an independent reconciliation layer. It helps validate DAX measures, denominators, filter behaviour and page-level card values.
What makes this BFSI-style?	It uses credit risk concepts, securitisation metrics, IFRS 9 ECL logic, validation notes, assumptions and investor reporting structure rather than only visual dashboard screenshots.
What is the key limitation?	The dataset is synthetic internship data and does not include a full tranche waterfall, contractual cash-flow engine or predictive PD/LGD modelling.
What is the strongest part of the project?	The dashboard covers the full surveillance workflow: exposure, composition, delinquency, ECL, loss, recovery, prepayment, stress and investor reporting.

14.13 Final Report Editing Notes

- Replace every screenshot placeholder with a cropped PNG exported from Power BI. Keep each screenshot around 60-75% of page width and avoid stretching.
- Do not paste Excel screenshots for tables that can be rebuilt manually. Use the themed report tables for validation summaries and only include two or three Excel visual references.
- After image insertion, review whether any heading is left alone at the bottom of a page. Move that heading or add interpretation before it.
- Keep all table headers in Deep Red with white text. Remove default Excel blue styling from any pasted tables.
- Use measured language. Do not claim regulatory compliance, forecasting accuracy or investor-grade cash-flow modelling unless those models are actually built.

14.14 Additional Business Commentary for Final Submission

Portfolio governance commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

A strong report page should follow a simple sequence: define the management question, present the KPI, explain the visual, interpret the result, state the risk implication and confirm the validation method. This structure makes the project more credible for internship submission and portfolio review.

Where the metric is assumption-driven, the assumption must be stated clearly. This is especially important for stress testing, credit enhancement and recovery rate logic because different institutions may define these measures differently.

Delinquency surveillance commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

A strong report page should follow a simple sequence: define the management question, present the KPI, explain the visual, interpret the result, state the risk implication and confirm the validation method. This structure makes the project more credible for internship submission and portfolio review.

Where the metric is assumption-driven, the assumption must be stated clearly. This is especially important for stress testing, credit enhancement and recovery rate logic because different institutions may define these measures differently.

Provisioning commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

A strong report page should follow a simple sequence: define the management question, present the KPI, explain the visual, interpret the result, state the risk implication and confirm the validation method. This structure makes the project more credible for internship submission and portfolio review.

Where the metric is assumption-driven, the assumption must be stated clearly. This is especially important for stress testing, credit enhancement and recovery rate logic because different institutions may define these measures differently.

Loss and recovery commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

A strong report page should follow a simple sequence: define the management question, present the KPI, explain the visual, interpret the result, state the risk implication and confirm the validation method. This structure makes the project more credible for internship submission and portfolio review.

Where the metric is assumption-driven, the assumption must be stated clearly. This is especially important for stress testing, credit enhancement and recovery rate logic because different institutions may define these measures differently.

Prepayment commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

A strong report page should follow a simple sequence: define the management question, present the KPI, explain the visual, interpret the result, state the risk implication and confirm the validation method. This structure makes the project more credible for internship submission and portfolio review.

Where the metric is assumption-driven, the assumption must be stated clearly. This is especially important for stress testing, credit enhancement and recovery rate logic because different institutions may define these measures differently.

Stress testing commentary

This commentary can be used below the relevant dashboard screenshot when additional explanation is required. It explains the business reason for the metric, the risk interpretation and the control requirement in a formal BFSI reporting tone.

The reviewer should be able to understand what the metric measures, why it matters, which source table supports it and how it should be reconciled. The dashboard should therefore be presented as a controlled analytical workflow rather than a collection of visuals.

14.15 Final Reviewer Notes for Portfolio Presentation

Reviewer Note 1

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

Reviewer Note 2

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

Reviewer Note 3

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

Reviewer Note 4

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

Reviewer Note 5

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

Reviewer Note 6

The final presentation of this project should focus on risk interpretation first and dashboard design second. A banking reviewer will look for the ability to explain exposure, delinquency, ECL, loss, recovery, prepayment and stress metrics in a controlled way.

Before submission, confirm that the screenshot placed on the page supports the paragraph around it. The screenshot should be medium-sized, cropped cleanly and followed by a direct business interpretation. Do not allow a dashboard image to occupy an entire page without explanation.

The report should also make it clear that this is a synthetic internship case study. That honesty improves credibility because it separates a portfolio analytics workflow from real regulatory or investment advice.

14.16 Closing Quality Statement

The completed report should be treated as a professional analytical pack. Its strength comes from combining dashboard design, credit risk vocabulary, securitisation context, metric logic and Excel validation. Final submission quality depends on inserting clear cropped screenshots and rechecking every page after export.

The completed report should be treated as a professional analytical pack. Its strength comes from combining dashboard design, credit risk vocabulary, securitisation context, metric logic and Excel validation. Final submission quality depends on inserting clear cropped screenshots and rechecking every page after export.
